

SHARING MADE EASY

Bynari Insight WebClient is a groupware web client that works on any web browser running on Windows®, Linux, or MAC®. The Insight WebClient works as a stand alone client with calendar, contacts and folder sharing. The WebClient also has the ability to share with any Outlook® clients. Major features like calendars, folders, and meeting scheduling can be shared among other Insight WebClient and Outlook users.

Outlook Functionality

Insight WebClient provides similar functions and features as Microsoft Outlook. Together with Bynari's email server, it allows you to check your mail and calendar, access files from a public folder, and schedule appointments, all from a web browser. The uniqueness of this client is its ability to exchange information with any version of Outlook clients and its ability to integrate with other open source email servers. Any updates made in the WebClient are automatically synced with the user's Outlook client.

Standardization

Access the application through any web browser, such as Internet Explorer, Netscape, Mozilla, or Opera. Insight WebClient requires no special software to be installed on each desktop.
