

SHARING MADE EASY...

ADVANCED GROUPWARE FUNCTIONALITY

neonInsight is a Linux based email server that sets very high standards for messaging solutions. Utilizing open standards and a high level of compatibility, neonInsight delivers what companies need for a 24/7 email solution.

neonInsight was developed from 25 years of experience providing bullet-proof Messaging and Groupware solutions to some of the largest organizations in the world.

neonInsight is an affordable, easy to manage, email server designed for small to enterprise level customers. It provides a robust, centralized administration panel to easily manage the whole messaging environment.

NEONINSIGHT ADVANTAGE

- Outlook® (2000-2007) groupware support
- Sunbird© and Evolution® support
- Full-function groupware web client included
- Full support for Windows™ and Linux desktop clients.
- Centralized administration and configuration from an intuitive web client, even in a multi server distributed environment.
- Interoperable with other Messaging and Groupware email servers.
- Low Total Cost of Ownership
- 99.9+ availability out-of-the-box
- Easily integrates into existing infrastructure
- Leverage existing IT and end user skills

COMPLETE INFRASTRUCTURE

neonInsight scales easily to manage hundreds of thousands of users and has been time tested in multiple enterprise customer installations.

neonInsight is more than just an email server, it combines scalability and higher availability into one system with centralized and distributed components.

neonInsight incorporates migration tools, backup and recovery tools, spam and virus protection, load balancing options, and email archiving tools.

neonInsight can talk to any email client like Outlook®, Sunbird©, Evolution®, and web clients and share groupware features like calendars, contacts, and folders.

RELIABLE AND COST EFFICIENT

Email is the most prevalent form of communication. Email servers must be operational 24/7, 365 days/year for all businesses. neonInsight is designed to provide reliability beyond a typical email server.

neonInsight offers file-system storage for robust messaging. It does not have a database which causes corruption and poor performance. It provides load-balancing through component level scaling and redundancy that allows for virtually unlimited scalability. In addition, with single-instance storage, it provides significant storage savings (could be over 50% at some sites).

neonInsight allows multiple instances on the same machine, "application level virtualization", which allows you to get more out of your hardware investment. It fully utilizes your hardware vs. other email servers that never use more than 30% of the CPU.

neonInsight can use your current company's central directory to reduce administration of email users.

neonInsight, with appropriate operating and hardware systems, reduces the total cost of ownership (TCO) significantly by increasing the efficiency of your hardware.

NEONINSIGHT FEATURES

ADMINISTRATION ADVANTAGE

neonInsight provides online system configuration that does not need a restart for configuration changes. It has an on-the-fly backup/restore for incremental backups with single object backup/restore.

neonInsight supports limited visibility for group and mailing list addresses thereby limiting who can see, and send to, groups or mailing lists. With single domain/multiple system mail routing, email addresses for all users can be routed to different internal messaging systems on different systems.

Quota classes are enhanced to ease user creation and management and to minimize system load.

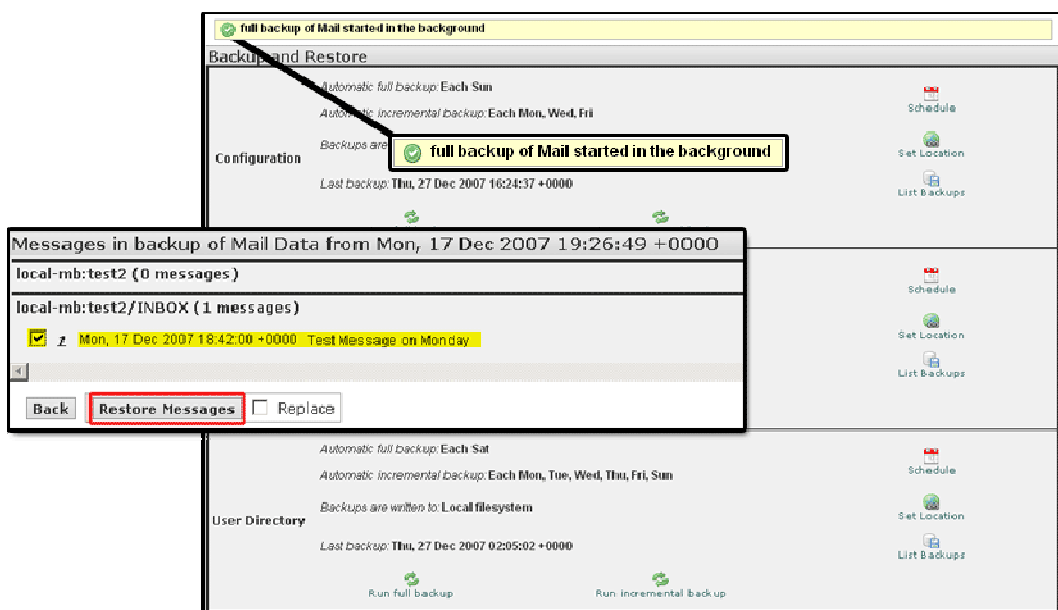

HOSTING FOR SERVICE PROVIDERS

neonInsight adds multiple features for email service providers. With unlimited virtual domains, you can seamlessly host multiple companies. Private domains are supported in conjunction with the unlimited virtual domains.

neonInsight allows for multiple system administrators, multiple domain administrators, and group owners to manage their own groups.

neonInsight supports virtually unlimited namespaces. Users can have their own personal space with its own quota and store information on a different location on the disk for archiving purposes.

- Directory Independence
- WAP support for email
- Single instance storage for significant storage savings (over 50% for some sites)
- File-system based storage for optimized performance and robustness (no database corruption and backup difficulties)
- On-the-fly system configuration –no restart needed
- Multiple levels of systems administrators
- Email Archiving
- Integration of Webdav for free/busy information
- Multi-platform support (It is supported on all IBM eServers under Linux)
- Quota Classes
- Migration tools for Exchange® and IMAP servers
- On-the-fly Backup and Restore
- Local send/receive
- Application level virtualization
- GUI Spam and Virus protection
- Single-Domain/Multiple system mail routing
- Load Balancing/Redundancy/Scalability
- Unlimited Virtual Domains
- System statistics
